

Cast Steel Roll Specifications

GRADE: Special Alloy Cast Steel

Union Electric Åkers
Forged and Cast Rolls

DESCRIPTION

These are high alloy rolls which have been developed to meet the conditions in specific applications including structural and vertical edging rolls.

The rolls are alloyed with manganese, chromium and molybdenum and are given a sophisticated heat treatment to produce the combination of properties most appropriate for the mill duty.

The structure produced depends upon the hardness and the carbon content and varies from a fine pearlite to a very fine pearlite with some bainite. With the higher carbon rolls there will also be some free carbide present.

The high strength associated with good resistance to wear and firecracking make Special Alloy Cast Steel rolls very suitable for use in a range of structural mill work rolls and edging applications.

APPLICATIONS

Product	Type of Mill	Position
Wide Strip	2, 3 and 4 High	Roughing
Wide Strip	4 High Continuous	Vertical Edgers
Medium Section	2 and 3 High	Roughing and Intermediate
Heavy Section	2 and 3 High	Roughing, Finishing and Intermediate

TYPICAL MECH. PROPERTIES

Property	N/mm ²	
	Low Carbon	High Carbon
Tensile Strength	900	650
Bending Strength	1300	1000

DEPTH OF HARDNESS

MICROSTRUCTURE X500

AIM CHEMISTRY (WT%)

Code	Leeb E	Shore C	C	Si	Mn	Ni	Cr	Mo
